

Glycaemic Control and Diabetes Review

Source: Neuron Cardiometabolic Guidelines

Diagnosis

Confirm diabetes with a glycated haemoglobin of 48 millimoles per mole or above on two occasions in an asymptomatic patient.

Monitoring

Repeat glycated haemoglobin every three to six months until stable, then every six months. Review adherence and lifestyle before intensifying therapy.

Complication screening

Arrange annual retinal screening, foot assessment, and urine albumin to creatinine ratio for every patient with diabetes.

Escalation

Glycated haemoglobin above 86 millimoles per mole, or any episode of severe hypoglycaemia, requires prompt specialist diabetes review.
