

Lipid Management and Cardiovascular Risk

Source: Neuron Cardiometabolic Guidelines

Risk assessment

Use a full lipid profile alongside blood pressure, smoking status, and family history to estimate ten-year cardiovascular risk before offering treatment.

Targets

Aim for a greater than 40 percent reduction in non-HDL cholesterol after starting a statin. Recheck the lipid profile three months after initiation or a dose change.

Lifestyle

Offer structured dietary advice, weight management, and physical activity support alongside any pharmacological therapy.

Escalation

Total cholesterol above 9 millimoles per litre or triglycerides above 20 millimoles per litre suggests a familial or secondary cause and requires specialist lipid clinic referral.
