

Liver Function Abnormality Workup

Source: Neuron Hepatology Standards

First steps

Repeat abnormal liver enzymes after four weeks unless the patient is unwell. Record alcohol intake, medicines, and metabolic risk factors.

Non-invasive testing

Request a liver screen including viral serology and an ultrasound when transaminases remain raised beyond three months.

Escalation

Alanine aminotransferase above five times the upper limit of normal, or any jaundice with coagulopathy, requires same-day hepatology assessment.

Follow-up

Recheck liver function three months after a medication change that could account for the abnormality.
