

Medication Reconciliation Standard

Source: Neuron Medication Safety Library

Process

Reconcile the full medication list at every clinical encounter, including over-the-counter and herbal products.

High-risk drugs

Pay particular attention to anticoagulants, insulin, methotrexate, lithium, and diuretics because these carry the highest harm potential.

Monitoring

Confirm that the required monitoring bloods for each high-risk medicine are up to date and document the next due date.

Escalation

Any suspected adverse drug reaction that caused harm should be reported and reviewed by the prescribing clinician within one working day.
