

Thyroid Function Interpretation Guide

Source: Neuron Endocrine Protocol Library

Interpretation

Interpret thyroid stimulating hormone together with free thyroxine. An isolated abnormal thyroid stimulating hormone result should be repeated after two to three months before treatment.

Hypothyroidism

Start levothyroxine when thyroid stimulating hormone is persistently raised with a low free thyroxine. Recheck thyroid function six to eight weeks after any dose change.

Hyperthyroidism

A suppressed thyroid stimulating hormone with a raised free thyroxine warrants endocrine referral. Check for atrial fibrillation in older patients.

Escalation

Thyroid stimulating hormone above 10 milliunits per litre with symptoms, or any suspicion of thyroid storm, requires urgent specialist input.
