

Vitamin D and Bone Health Protocol

Source: Neuron Clinical Protocol Library

Testing

Measure serum 25-hydroxyvitamin D only when deficiency is clinically suspected or in patients with malabsorption or bone disease.

Replacement

Treat levels below 25 nanomoles per litre with loading doses followed by maintenance therapy, and recheck after three to six months.

Calcium

Check adjusted calcium before starting high-dose vitamin D to exclude undiagnosed hypercalcaemia.

Escalation

Adjusted calcium above 3.0 millimoles per litre is a medical emergency and requires immediate assessment.
